EDUCATION

Cornell University-- Bachelor of Science **Ithaca, NY**

College of Engineering. Major: Computer Science; Minor: Applied Economics *August 2023 – May 2027*

GPA: 3.8/4.0

Relevant Coursework: NLP; Probability, Vectors, and Matrices in Computing; ML; Algorithms; AI Reasoning; Data Structures (Java, OCaml); Discrete Math; Probability Models and Inference, Linear Algebra; Computer Systems; OS

Skills: Java, Python, C++, TypeScript, OCaml, Swift, Objective-C, TensorFlow, ONNX, React, Next.js, FastAPI, Protobuf, ROS, Git

PROFESSIONAL EXPERIENCE

Google—Photos **Cambridge, MA**

Incoming Software Engineering Intern *August 2026 – Present*

Meta—Ads **Bellevue, WA**

Software Engineering Intern *May 2026 – August 2026*

- Resolved a data integrity bug affecting 0.5%+ of daily browsing sessions across Facebook and Instagram's mobile browser autofill system serving billions of users, where form data from one tab would leak into and corrupt another tab's state—impacting user trust and autofill accuracy at scale
- Designed and shipped an architectural overhaul across Android and iOS, replacing a legacy shared singleton state model with isolated per-tab form states; owned project end-to-end from systems design through production experimentation, completing the final phase of a multi-quarter platform restructuring
- Proactively discovered and fixed 2 additional user-facing bugs through novel multi-tab isolation tests, leveraging AI-assisted development to accelerate codebase exploration, implementation, and test generation beyond the original project scope

Google—YouTube **San Bruno, CA**

Software Engineering Intern *May 2025 – August 2025*

- Developed a full-stack feature for YouTube Music's in-app lyrics for Android and iOS that is used by tens of millions of listeners worldwide; was able to launch feature to production
- Resolved a critical yearlong bug by implementing and launching a lyrics text direction fix that enhanced the accessibility and readability of lyrics across different song and app languages, improving the experience for a global user base
- Engineered a complex transition animation using a low-level internal language with minimal documentation, discovered and fixed a critical animation framework bug, improving reliability for all developers, receiving positive feedback from senior engineers

Google—Search **Mountain View, CA**

Software Engineering Intern *May 2024 – August 2024*

- Implemented a full-stack feature for an internal experiment launch tool by extracting data from the internal tool's metamodels using Java and a Google internal configuration language and rendering detailed tables using Typescript and HTML
- Created a standardized file format using an internal configuration language to extract shared attributes from a collection of attribute files, reducing manual effort of modifying files and improving efficiency

PROJECTS

Cornell Health Hackathon – Optimized Waiting Room *March 2026*

- Engineered an end-to-end ML pipeline using WavLM to extract respiratory biomarkers from patient voice data and a Random Forest classifier to combine model predictions with patient symptoms and contextual factors, dynamically updating emergency room queue priorities

Hybrid Body Lab – KnitDema *January 2026 – May 2026*

- Developed a computer vision pipeline using OpenCV and MediaPipe to automatically measure hand dimensions and generate custom glove bitmaps, eliminating manual lab measurements; integrated Bluetooth connectivity with a TypeScript application to enable real-time interaction with a sensor-equipped treatment glove

CalHacks AI – Tissue.AI *June 2025*

- Developed a full-stack application using Next.js, React, Tailwind, and FastAPI that helps developers resolve GitHub issues by analyzing repo structure and generating actionable insights using Letta's MemGPT multi-agent system and engineered robust backend workflows with Pydantic schemas, GitHub API integration, and asynchronous agent orchestration and integrated an interactive code viewer using Monaco Editor to streamline developer experience

Cornell University Autonomous Drone (CUAD) Project Team *October 2023 – May 2026*

- Developed a custom YOLO model using Tensorflow and ONNX to analyze images and detect mission-critical objects for autonomous drone missions, collaborating with other subteams to ensure accurate system integration and built a ROS-based API in a Linux environment to automate and run Gazebo simulations of drone movement, takeoff, and landing functionalities, enabling efficient testing and iteration development

LEADERSHIP EXPERIENCE

CS 2110: Data Structures and Object-Oriented Programming (Java) **Ithaca, NY**

Teaching Assistant *January 2025 – May 2026*

- Selected from a competitive pool of applicants to support 500+ students by leading weekly discussions and office hours, contributing to course development, and simplifying complex Java and data structures concepts through clear explanations and examples
